

KIMMCO Glasswool Insulation Products

Material Storage and Handling

We, Kuwait Insulating Material Manufacturing Co. (KIMMCO), recommend the following storage conditions:

- Glasswool Insulation Products should be stored in a well lit, dry and protected area.
- Glasswool Insulation Products should be kept in its original packaging to avoid any penetration of moisture and dust or foreign contamination
- All packages should be elevated above the ground or slab, away from the walls, and stored on a flat surface. This helps prevent contact with water and allows air to circulate in and around the insulation.
- If stored outside and in open area, packages should be protected with a polyethylene film, canvas or other type of covering.
- Material should be kept dry and protected from the elements.
- Please ensure that temperature in the storage area should not be high as the polyethylene sheathing used for packaging will soften and loose its strength when temperatures exceed 220°F (104°C).

NOTE:

The easiest way to avoid damaging the insulation is to arrange delivery so that it can be installed as soon as it arrives.
